93. Which of the following units is the relative mass of a molecule expressed in atomic mass units and is calculated by adding together the atomic weights of the atoms in the molecule?

a. Atomic number
b. Mass number
c. Mass number
d. Atomic weight

ANSWER: c

QUESTION TYPE: Multiple Choice

94. Why are the atomic weights of elements defined as the relative masses of average atoms of the elements?

ANSWER: The mass number of an isotope is the sum of the number of protons and neutrons in the nucleus of the atoms of the isotope. Also, both protons and neutrons have masses of 1 u. Since the masses of electrons are quite small, the atomic weights of isotopes are almost equal to their mass numbers. Therefore, the atomic weights of elements can be defined as the relative masses of average atoms of the elements.
